

1. Check if Python is Installed

Open:

- Command Prompt (Windows)
- Terminal (Mac)

Run the following command:

```
1 python --version
2 `
```

Expected Output:

You should see a Python version like:

```
Python 3.x.x
```

If Python is not installed or the command is not recognized, please install Python (version 3.9–3.11 recommended) before proceeding.

Check if pip is Installed

```
1 pip --version
```

OR

```
1 pip3 --version
```

If you see a version → pip is already installed

If pip is NOT recognized:

```
1 python -m ensurepip --upgrade
```

OR

```
1 python -m pip --version
```

2. Install Required Libraries

Run the following command in Command Prompt / Terminal:

```
1 pip install numpy pandas matplotlib seaborn scikit-learn jupyter openpyxl
```

This will install all the libraries needed for the session:

- Data handling
- Visualization
- Machine Learning
- Notebook environment

Important Notes

Make sure you have a stable internet connection while installing.

If you face permission issues, try:

```
1 pip install numpy pandas matplotlib seaborn scikit-learn jupyter openpyxl
```

3. Verify Your Setup

After installation, open Command Prompt / Terminal and run:

```
1 python
```

Then type the following one by one:

```
1 import pandas as pd
2 import numpy as np
3 import sklearn
4 import matplotlib
5 import seaborn as sns
```

PYTHON

If no errors appear, your setup is successful

Troubleshooting Tips

If pip is not recognized:

```
1 python -m pip install numpy
```

If python is not recognized, try:

```
1 py --version
```

Note

Completion of Programming Foundations course is add on.
